Problem Statement for Shopping cart project

- Our project is about online shopping application

The way we are going to design our app is that the app will have access to data base to get the information of the products available in our shopping cart and the information of our customers

- A customer can make an order and add products to his own cart . He can have as many products as he wants in his cart.
- Payment is executed when ever order is confirmed and verified
- Supplier ships products to customers
- Supplier add products and remove products
- Refund policy

We will thrive to make things simple and user friendly, fast shipment , accepting payments with different type of payments(credit cards ,master card ,visas). This could be a challenging task to do or to implement. The problems we can encounter financial costs and others.

If these problems listed are not handled very well it could be a major obstacle in our progress. If there is less communication between the customer and the supplier the way shipment is handled then it could cause unhappy customers and less buyers.
